Secure Login Page

User Story & Acceptance Criteria

User Story

As a user, I want to log in safely using my email and password, so that I can open my account and keep my data safe.

Acceptance Criteria — Functional & UI Scenarios (AC1 – AC10)

AC1 Positive Scenario — Successful Login

POSITIVE

Given the user is on the login page, when they enter a correct email and password, then the system opens their account and goes to the home page.

AC2 Negative Scenario — Invalid Login

NEGATIVE

Given the user is on the login page, when they enter a wrong email or password, then the system stops them and shows a general message like “Wrong email or password” (without saying which one exactly is wrong, for security).

AC3 Negative Scenario — Empty Fields Validation

NEGATIVE

Given the user is on the login page, when they leave the fields empty and click login, then the system highlights the empty box in red and says “Please write your email and password” before sending anything to the server.

AC4 UI Feature — Password Masking (Hide / Show)

UI / NAVIGATION

Given the user is typing the password, when they type, the text is hidden and looks like dots (••••••). Then if they click the “Eye” icon, they can see the letters they typed.

AC5 **Security — Prevent Brute Force (Account Lockout)** SECURITY / EDGE

Given a hacker is trying to guess the password, when they enter the wrong password 5 times in a row, then the system locks the account for 15 minutes to stop them.

AC6 **Edge Case — Long Text & Empty Spaces** SECURITY / EDGE

Given the user is typing their email, when they write too many letters (more than 100) or leave spaces before the email by mistake, then the system limits the text length, removes the extra spaces automatically, and keeps the app working.

AC7 **Security — Prevent SQL Injection (SQLi)** SECURITY / EDGE

Given the user is on the login page, when a hacker writes bad database code (like 0' OR '1'='1), then the system cleans this code so they cannot steal data from our database.

AC8 **Security — Prevent Scripts & HTML (XSS)** SECURITY / EDGE

Given the user is on the login page, when a hacker writes JavaScript code (like <script>) or HTML (like <iframe>), then the system changes it into normal text so it does not run in the browser.

AC9 **Security — Safe Network (HTTPS Encryption)** SECURITY / EDGE

Given the user clicks login, when the password travels from the phone/computer to the server, then the connection must be locked (encrypted with HTTPS) so no one on the internet can read it.

AC10 **Navigation — Forgot Password Link** UI / NAVIGATION

Given the user is on the login page, when they forget their password and click “Forgot Password?”, then the system takes them to a safe page to create a new password.
